# HIGH-POWER FUELCELL VEHICLE DEVELOPMENT

Vehicle Projects LLC has a unique history of leading large fuelcell vehicle projects from design through implementation.

## *METAL-HYDRIDE STORAGE*

*Primarily for safety, both the mine locomotive and mine loader use reversible metal-hydride storage. Photo shows half of the hydride storage system being lowered into the loader. The vehicle stores 14 kg of hydrogen and can be refueled in 10-15 minutes.*

# DESIGN TO IMPLEMENTATION - HYBRID SWITCHER

The switcher locomotive is a fuelcell-battery hybrid whose prime mover provides 250 kW of continuous net power for traction or power-to-grid.

An auxiliary lead-acid traction battery allows transient power in excess of 1 MW. Carbon-fiber composite tanks store 70 kg of hydrogen at 350 bar.

Project start to demo in LA railyard - 20 months

## LIMITS OF HYDROGEN VOLUMETRIC DENSITIES

Fuel Occupying 1.0 L <sup>a</sup>	Conditions of Storage	H <sub>2</sub> Mass <sup>b</sup>
Gaseous H <sub>2</sub>	350 bar (5,100 psi)	25 g
Liquid H <sub>2</sub>	$\rho = .070 \text{ g/mL}$ (P = 1 bar, T = bp)	70 g
Methanol <sup>c</sup>	$\rho = .79 \text{ g/mL}$ , (T = 25 C)	99 g
Liquid Ammonia	$\rho = 0.62 \text{ g/mL}$ , (P = 7.2 bar, T = 15 C)	110 g
Reversible Metal Hydride	AB <sub>5</sub> alloy (LaNi <sub>5</sub> ), $\rho = 8.3 \text{ g/mL}$ , wt % = 1.5, 10 bar	125 g

<sup>a</sup> Fuel only – container and processor excluded

<sup>b</sup> Henceforth, density will use the units kg/m<sup>3</sup>. Note that n kg/m<sup>3</sup> = n g/L.

<sup>c</sup> Reforming to hydrogen requires water also:  $\text{CH}_3\text{OH} + \text{H}_2\text{O} \rightarrow 3\text{H}_2 + \text{CO}_2$ . In principle, water can be obtained from the fuelcell.

# THEORETICAL vs PRACTICAL STORAGE VOLUMES

For 100 kg Hydrogen Storage:

Fuel System	Theoretical (Limit) Volume, <sup>a</sup> m <sup>3</sup>	Practical System Volume (PSV), m <sup>3</sup>
Compressed hydrogen <sup>b</sup>	4.0	10.
Liquid hydrogen <sup>c</sup>	1.4	3.9
Methanol Reformer <sup>d, e</sup>	1.0	4.3
Ammonia Dissociator <sup>d, f</sup>	0.90	2.3
Reversible Metal Hydride <sup>g</sup>	0.80	5.0

<sup>a</sup> Def: 100 kg storage / Theoretical H<sub>2</sub> mass in 1.0 m<sup>3</sup> of fuel (previous slide); e.g., 100 kg / 25 kg/m<sup>3</sup> = 4.0 m<sup>3</sup>

<sup>b</sup> Practical System Volume (PSV) (prismatic) based on Dynetek™ W205H350G8N carbon-fiber composite tanks, plus ancillaries

<sup>c</sup> PSV based on BMW Hydrogen 7™ automotive system

<sup>d</sup> PSV assumes 17 kg/h H<sub>2</sub> consumption rate, corresponding to 300 kW gross from Ballard™ P5 fuelcell powerplant

<sup>e</sup> PSV based on volume of six Intelligent Energy Hestia™ reformers, 50 kW each. Includes volume of reactant water

<sup>f</sup> PSV based on volume of scaled Intelligent Energy MesoChannel™ ammonia dissociator

<sup>g</sup> PSV based on measured volume of Vehicle Projects LLC mine loader storage system

## *PRACTICAL STORAGE DENSITIES: RESULTS*

<b>Fuel System</b>	<b>Practical Density,<sup>a</sup> kg H<sub>2</sub> / m<sup>3</sup></b>	<b>Storage Efficiency<sup>b</sup></b>
<b>Compressed H<sub>2</sub></b>	<b>10</b>	<b>40%</b>
<b>Reversible Metal Hydride (AB<sub>5</sub>)</b>	<b>20</b>	<b>16%</b>
<b>Methanol Reformer</b>	<b>23</b>	<b>23%</b>
<b>Liquid H<sub>2</sub></b>	<b>26</b>	<b>37%</b>
<b>Ammonia Dissociator</b>	<b>44</b>	<b>40%</b>

<sup>a</sup> Def: 100 kg / Practical System Volume; e.g., for liquid H<sub>2</sub>: 100 kg / 3.9 m<sup>3</sup> = 26 kg/m<sup>3</sup> = 26 g/L

<sup>b</sup> Def: Practical Density / Theoretical Density x 100%; e.g., for liquid H<sub>2</sub>: 26 kg/m<sup>3</sup> / 70 g/L x 100% = 26 kg/m<sup>3</sup> / 70 kg/m<sup>3</sup> x 100% = 37%. "Storage Efficiency" is a measure of how closely a storage system approaches its volumetric density limit.

## *CONCLUSIONS*

**With today's technology:**

- **Highest practical hydrogen volumetric density: Liquid ammonia (44 kg/m<sup>3</sup>)**
- **Lowest practical hydrogen volumetric density: Compressed hydrogen (10 kg/m<sup>3</sup>)**
- **Highest storage efficiency: Compressed hydrogen or liquid ammonia (40% each)**
- **Lowest storage efficiency: Reversible metal hydride (16%)**
